2026-06-20

CONTENTS

1. 1. How This Engagement Works

- 02. 1.1 What I (the dev) handle, end-to-end
- 03. 1.2 What I need from you (the client) to start
- 04. 1.3 What you (the client) need to do yourselves
- 05. 1.4 What you get

2. 2. What "Phase 2" Means Here

3. 3. The Zero-Cost Unlocks

- 08. 3.1 Testimonials — drop in a signed .md, the section appears
- 09. 3.2 Content edits (services, hours, FAQ, access banner)

4. 4. The Pre-Scoped Workstreams

- 11. 4.1 Small (typically a single focused engagement)
- 12. 4.2 Small-to-Medium
- 13. 4.3 Medium (multi-week engagement)
- 14. 4.4 Large + separate compliance workstream (months, not weeks)
- 15. 4.5 BIMl (cost-transparent "nice-to-have")

5. 5. The 30-Day Support Window (Free Phase 2 Tier)

6. 6. How to Start a Phase 2 Engagement

7. 7. Phase 1 Market Value Anchor

8. 8. Cross-References

What this document is: a single-page map of every "Phase 2" item the client may hear about after launch — what each one is, what it costs, and how to start the engagement. This is the working reference for the board and the intake coordinator; it is not a quote and it is not a contract. Every Phase 2 workstream is a separate engagement, scoped and priced when requested.

Cross-references:

- The proposal (what was built, what's optional): `CLIENT-PROPOSAL.md`
 - 42 CFR Part 2 testimonial compliance worksheet (the Phase 2 tool for adding compliant social proof): `TESTIMONIAL-REVIEW.md`
 - The compliance audit trail: `COMPLIANCE.md`
 - Editing guide for day-to-day content changes (intake coordinator): `EDITING_GUIDE.md`
-

1. How This Engagement Works

Every Phase 2 workstream runs on the same four-quadrant model — same pattern as the Phase 1 transfer moment in `CLIENT-PROPOSAL.md` §14.3.2, applied to ongoing engagement rather than one-time handoff. The four quadrants make explicit who does what, and what's delivered, **before any work begins**. No workstream is absorbed silently.

1.1 What I (the dev) handle, end-to-end

For every Phase 2 workstream — regardless of size:

- **Scope confirmation** — explicit yes/no on whether the requested change fits a pre-scoped workstream (§4 below) or needs re-scoping into a custom change request per the three-category model in §2.
- **Written estimate** — hours or fixed-fee, with target start date, in your inbox before any work begins.
- **Implementation** — code, content, configuration, and tests per the approved scope.
- **Verification** — Pre-Demo Checklist-equivalent for the workstream (Lighthouse, accessibility, 42 CFR Part 2 review if applicable, build passes).
- **Deploy** — pushed via `wrangler pages deploy ./dist` to the client's Cloudflare Pages project (same mechanism used for Phase 1); live in ~30 seconds after build.
- **Documentation update** — `COMPLIANCE.md`, `EDITING_GUIDE.md`, and this `PHASE-2.md` (if the workstream adds a new pre-scoped item) all updated to reflect the change.
- **30-day post-delivery support** for the delivered workstream — bug fixes + small copy edits, same terms as the Phase 1 support window.

1.2 What I need from you (the client) to start

Need	Why
Written approval of the estimate	Email is fine — triggers work to begin. No code is written, no account is created, no estimate is started without it.
Authorizing email (if a new vendor account is needed)	Same model as Phase 1: one identity per vendor, one inbox to watch for transfer notifications. Rare for Phase 2 — most workstreams reuse existing accounts.
Content / assets (if applicable)	E.g., translated copy for the Spanish site; clinician bios for the staff page; testimonial consent forms per <code>TESTIMONIAL-REVIEW.md</code> .
Compliance sign-off (if applicable)	42 CFR Part 2 review for any new testimonial, staff credential that implies SUD specialty, or patient-facing content. The dev flags this in the estimate; the client owns the sign-off.

1.3 What you (the client) need to do yourselves

Step	Why
Communicate internally	Board, intake staff, IT — anyone affected by the change (especially for the staff page, donations, or any visible UI change).
Accept the change at deploy	A quick "looks good" reply in the dev's notification email. The change is live by then; the acceptance is the formal close.
Add any new credentials to your password manager	Only if a new vendor account was created (rare — most Phase 2 workstreams don't need one).
Schedule the work	Most Phase 2 workstreams need ~1 week's lead time for scoping + estimate before implementation starts. Larger ones (Spanish site, blog, staff page) need 2–4 weeks.

1.4 What you get

Deliverable	What it is
The workstream itself	Per the approved scope — e.g., the <code>/staff</code> page, the donation button, the Spanish translation, the testimonial section activating on the first signed <code>.md</code> drop.
Updated docs	<code>COMPLIANCE.md</code> (every §6 status), <code>EDITING_GUIDE.md</code> (if the change affects day-to-day editing), <code>PHASE-2.md</code> (if a new pre-scoped item was added).
Deploy verification	A short note in your inbox confirming the change is live, with the commit hash and the URL to verify.
30-day post-delivery support	Bug fixes + small copy edits for the delivered workstream — included, same terms as the Phase 1 support window.

The next sections describe the **what** — what workstreams are available, what they cost, what's already pre-built and waiting for your input. This section is the **how** — the engagement model that every workstream runs on.

2. What "Phase 2" Means Here

Phase 1 was the **website rebuild** — the work on disk at demo time: the static Astro build, the 42 CFR Part 2 compliance posture, the Cloudflare Pages hosting + Cloudflare account ownership, the editing guide, the Loom walkthrough, and the 30-day post-demo support window. **Phase 1 is a finished digital asset.**

Phase 2 is everything that comes next. It is not part of the original engagement and it is not absorbed into it silently. Every Phase 2 workstream is its own scoped engagement with its own estimate and its own written approval before any work begins.

There are **three categories** of Phase 2 work:

Category	What it is	Typical cost to start
Zero-cost unlocks	Features already built into the codebase that just need a signed authorization or a content file to activate.	\$0 dev cost. Time spent by your team (e.g., the 42 CFR Part 2 review for testimonials).
Pre-scoped workstreams	Common asks that have a known shape and a known relative size. Sized up front in this document and in <code>CLIENT-PROPOSAL.md</code> §12.2.	Hourly rate or fixed-fee quote at engagement start.
Custom change requests	Anything not in the catalog above. Quoted on request against an explicit scope.	Hourly rate against a written estimate.

3. The Zero-Cost Unlocks

These are features that **already work** in the codebase and just need your team to drop a file in or flip a switch. **No developer required.**

3.1 Testimonials — drop in a signed `.md`, the section appears

The `Testimonials.astro` component is **scaffolded with conditional rendering**: when the `src/content/testimonials/` collection is empty, no testimonial markup (heading, anchor, or card) is rendered. The moment you drop a `.md` file with the required frontmatter into that folder, the section, heading, and anchor appear automatically on the next build.

The structural guardrail: the Zod schema in `src/content/config.ts` **requires** two frontmatter fields on every testimonial entry — `consent_date` and `consent_hash`. If either is missing, the build **fails**. This means a non-compliant testimonial **cannot** be published accidentally — a developer would have to delete the schema to bypass it. 42 CFR Part 2 compliance is enforced at the build, not by a written policy.

The client workflow:

1. Use `TESTIMONIAL-REVIEW.md` to review a legacy testimonial (or draft of a new one) against the 42 CFR Part 2 consent standard. The worksheet contains pre-filled risk ratings for all 7 legacy testimonials, the keep/modify/drop decision table, a rewritten-text section, the 42 CFR §2.31 consent form template, and the signature block.
2. For each testimonial you want to publish, obtain a signed authorization on the consent form.
3. Create a `.md` file under `src/content/testimonials/` with the frontmatter (including `consent_date` and `consent_hash`) and the body text.

4. Send the file to the dev. The dev rebuilds and pushes via `wrangler pages deploy ./dist`. The site is live in ~30 seconds; the testimonial appears in the `#testimonials` section.

Time investment for your team: the consent-form collection, witnessing, and filing. The dev is not involved unless you want help with the technical file creation.

3.2 Content edits (services, hours, FAQ, access banner)

Anything in `src/content/` is editable by the intake coordinator in any text editor (VS Code, TextEdit, Notepad++, etc.) — the source code is delivered as a zipped archive in the handoff package. See `EDITING_GUIDE.md` for the non-technical walkthrough. Common edits:

- Change a service description → edit `src/content/services/*.md`
- Change hours → edit the relevant `.md` frontmatter
- Add an FAQ entry → edit `src/data/faq.json`
- Update the access banner (bilingual / Medicaid / no-wait) → edit the relevant `.md` file

No vendor portal, no support ticket, no cost. Send the updated file(s) to the dev for redeploy; live in ~30 seconds after the deploy.

4. The Pre-Scoped Workstreams

Sourced from `CLIENT-PROPOSAL.md` §12.2 (the canonical sizing table) and the §9.4 list of commonly-asked triggers. Sizes are **relative** — final pricing is a fixed-fee or hourly quote when you decide to start.

4.1 Small (typically a single focused engagement)

Workstream	What it adds	Notes
Testimonial compliance pipeline	Already structured (see §3.1 above). Zero dev cost.	The worksheet is the workstream.
Online donations (Stripe / Donorbox)	A "Donate" button in the header and a dedicated <code>/donate</code> page. Donorbox handles the PCI scope; you stay clean.	Free tier available; paid plans if volume grows.
Online booking (Calendly embed)	A Calendly widget on the Contact section. Full booking system is Medium–Large.	80/20 solution; minimal dev work.
Email newsletter signup	ConvertKit / Buttdown embed; double opt-in for compliance.	Double opt-in is a 42 CFR Part 2 hygiene feature, not optional.
NJ DOT impaired-driver self-scheduling	Calendly + form prefill.	Tightly scoped to the NJ DOT partnership flow.
Search functionality	Pagefind static search index.	Useful only after there are ≥ ~10 sections to search.

4.2 Small-to-Medium

Workstream	What it adds	Notes
Staff page (per-clinician bios)	A <code>/staff</code> section with bios.	42 CFR Part 2 review required for any credential that implies SUD treatment specialty (e.g., "CAADC", "SUD counselor"). Don't list credentials publicly without counsel sign-off.

4.3 Medium (multi-week engagement)

Workstream	What it adds	Notes
Full Spanish site (i18n)	Hero, Services, Testimonials, Form, Legal — all translated.	Spanish-speaking staff member on review duty. Bilingual staff already advertise this; full localization closes the gap.
Recovery stories blog (MDX)	<code>src/content/blog/</code> with markdown posts; RSS feed.	SEO benefit for long-tail terms. Staff writes in Markdown; same editor as services.
Multi-county SEO landing pages	One page per service county (Ocean, Monmouth, Burlington, etc.); each with localized copy.	Improves Google Maps / "near me" ranking.
CRM / intake automation	Form → CRM webhook.	Phase 1 form posts to email; Phase 2 wires it into your CRM of choice.

4.4 Large + separate compliance workstream (months, not weeks)

Workstream	What it adds	Notes
Client portal / login / telehealth	Authenticated patient area; possibly telehealth integration.	Requires HIPAA-compliant hosting, a Business Associate Agreement (BAA) with every vendor handling PHI, and a separate design + compliance workstream. This is a multi-month build and should not be conflated with the website rebuild.

4.5 BIMl (cost-transparent "nice-to-have")

Displays your logo next to authenticated email in supporting inbox clients (Apple Mail, Gmail for Workspace, Yahoo Mail). Purely visual — **not a security feature**. The DMARC rollout in §11.5 of the proposal already closes the actual phishing risk; BIMl is cosmetic on top.

Prerequisite	Cost	Timeline	Status for Agape
DMARC at <code>p=quarantine</code> or <code>p=reject</code>	\$0	Already in place at Phase 1	✓
USPTO-registered trademark on the logo	\$250–\$350 + attorney fees	6–12 months if not already registered	⚠ Need to confirm whether Agape has one
Verified Mark Certificate (VMC) from a CA (Entrust or DigiCert)	~\$1,200–\$1,500/year recurring	2–4 weeks after trademark confirmed	Not applicable until trademark exists
Self-hosted SVG logo at the BIMi record URL	\$0	Trivial	✓

Decision rule: the dev does not propose BIMi unless both (a) Agape has a USPTO-registered trademark and (b) the practice is willing to absorb the VMC annual cost. If both are true, the engagement is a ~\$1,500 setup + \$1,200–\$1,500/year.

5. The 30-Day Support Window (Free Phase 2 Tier)

This is the **Phase 2 free tier**: it's included with the build and runs for 30 days after the demo. It is NOT a separate engagement.

What is included, free, for 30 days post-demo:

- **Bug fixes** — any defect discovered in the first 30 days is fixed at no additional cost.
- **Small copy edits** — up to 30 minutes of small text changes per day (one at a time) are included.
- **DNS / cutover questions** — the dev walks the client through the final Town Square Interactive cancellation, the 301 redirect retirement, or any Cloudflare DNS issue.
- **DMARC monitoring** — verification that the `rua` mailbox is receiving aggregate reports; recommendations on policy escalation (e.g., `p=quarantine` → `p=reject` after 90+ days of clean reports).
- **[ATTORNEY REVIEW PENDING] marker drop** — once counsel signs off on the form-consent text, the marker is removed from production. No code change required; the wording is already in place.

What is NOT included (separate engagement):

- Anything new. After 30 days, support reverts to hourly or a separate maintenance agreement is signed.

- If a discovered issue is large (e.g., a 42 CFR Part 2 exposure not caught in the Pre-Demo Checklist), a separate engagement is opened and quoted.
-

6. How to Start a Phase 2 Engagement

The process is the same regardless of size:

1. **Email the dev** with the workstream name and any context (a paragraph is enough). Reference this document if it helps.
2. **Dev responds** with: scope confirmation, a written estimate (hours or fixed-fee), and a target start date.
3. **Client approves in writing** (email is fine). Work begins.
4. **Dev delivers** against the approved scope. A new revision of `CLIENT-PROPOSAL.md` is created if the workstream expands the original engagement.

There is no obligation to start any Phase 2 work. The site you have at demo time is the finished deliverable.

7. Phase 1 Market Value Anchor

For context, the rebuild that was just delivered — the Performance Build, the 42 CFR Part 2 Compliance Engineering, the Infrastructure Security & Mail Hardening, and the Structural SEO — would have a market value of approximately **\$7,500 – \$12,000** if commissioned from a HIPAA-aware web agency at standard rates. The §8 "What You Could Do Instead" table in `CLIENT-PROPOSAL.md` compares the Phase 1 fee against the closest alternatives.

This is the anchor for understanding why Phase 2 workstreams are quoted as separate engagements: they are real work, against a real codebase, at a rate that is consistent with the value already delivered.

8. Cross-References

- `CLIENT-PROPOSAL.md` — the proposal (read first)
- `PHASE-1-ENGAGEMENT-AGREEMENT.md` — the contract (sign and return)
- `COMPLIANCE.md` — the §6 audit trail (attorney-relevant)

- `TESTIMONIAL-REVIEW.md` — the 42 CFR Part 2 worksheet for adding compliant testimonials (the highest-leverage zero-cost unlock)
 - `EDITING_GUIDE.md` — non-technical guide for day-to-day content edits (delivered at the demo)
 - `DESIGN.md` — the internal spec (for any future developer)
-

End of Phase 2 Index. This document is informational and is not a quote. Every workstream is sized and priced when requested.

Last updated: 2026-06-20 (post-G.23 Cloudflare Pages hosting pivot).
