56. 14.3 The Operating Cost (Annual, Going Forward)

57. 14.4 The Strategic Value (Hard to Put a Number On)

58. 14.5 The Risk Reduction

59. 15. Next Steps

From a 4-page WordPress site on a managed SaaS — to a single-page lifeline that loads in under a second, costs \$0/month to host, and meets federal 42 CFR Part 2 confidentiality requirements.

1. Executive Summary

TL;DR; We replaced a vendor-locked, \$1,788/year WordPress site — which exposed Agape to federal 42 CFR Part 2 violations and ran four ad-tech trackers on every visitor — with a free, owned, single-page website that loads in under 1.5 seconds on a mid-range mobile phone and ships zero tracking scripts. The new build is a finished, demo-ready digital asset: Lighthouse 100/100/100/100 across Performance, Accessibility, Best Practices, and SEO (verified per DESIGN.md v2.18.0 Pre-Demo Checklist: 62 pass / 0 fail / 1 warn); full WCAG 2.1 AA compliance; and every 42 CFR Part 2 surface we identified on the live audit is closed. The board inherits a GitHub-owned repository, a Markdown-based content editing model any non-technical team member can run, and a handoff package that includes the compliance trail, an editing guide, and a 30-day post-demo support window. **Bottom line for the board:** the rebuild pays for itself in the first year by eliminating the \$1,788/year SaaS fee and keeps saving that money every year after — while moving Agape's public-facing compliance posture from "at risk" to "documented and structurally enforced."

The site at agapenj.org has done its job for years, but the platform underneath it (Town Square Interactive / Beacon Easton) was designed for generic small-business marketing, not for a **substance use disorder treatment program** in 2026. The result is a site that:

- **Costs \$149/month** in recurring SaaS fees for code you don't own — **\$1,788/year**
- **Loads slowly** on mobile (multiple trackers, jQuery, lazy-load after paint)
- **Exposes a Google Maps API key** in its HTML — a billing risk
- **Embeds Facebook twice** — a real concern under **42 CFR Part 2** (federal SUD confidentiality)
- **Shows a modal popup on first visit** that gates critical access information (Medicaid, bilingual, no-wait) behind a click

This proposal documents what we changed, why each change protects Agape, and what the rebuild will cost you going forward.

The headline numbers:

	Before	After
Pages	4 (Home, Services, Reviews, Contact)	1 (consolidated, 301-redirected)
Initial JS payload	~200 KB	0 KB
Trackers / third parties	5+ (GA, GA4x2, GTM, FB SDK, Maps)	0 (Cloudflare Web Analytics is cookieless and doesn't profile)
Annual hosting & CMS	\$1,788 (\$149/mo)	\$0
Lighthouse (mobile)	unknown / likely 50–70	Verified 100 / 100 / 100 / 100 (Lighthouse 13.x; see DESIGN.md v2.18.0 Pre-Demo Checklist)
WCAG 2.1 AA	unknown	Compliant
42 CFR Part 2 posture	At risk (FB embeds, third-party trackers)	Compliant
Code ownership	Vendor	You (full GitHub repo)

2. The Site We Inherited

TL;DR; Our 2026-06-18 audit of agapenj.org found a live WordPress site on the Beacon Easton theme, hosted by Town Square Interactive for \$149/month, running ~200 KB of legacy JavaScript (including a 2014-era jQuery 1.12 with known XSS vectors in jQuery UI 1.11), four ad-tech trackers on every page load (a deprecated Universal Analytics ID, two GA4 properties, Google Tag Manager, and the Facebook SDK), a Google Maps API key sitting in the page source for anyone to copy, and Facebook timeline embeds on both the home and reviews pages. The content itself was solid — address, phone, hours, services, and seven testimonials were real and current — but the platform was designed for generic small-business marketing, not for a substance use disorder treatment program subject to stricter-than-HIPAA federal regulations. The mobile sticky Call button was well-implemented; SEO basics were in place; the access information (Medicaid, bilingual, no-wait) was correct but trapped behind a modal popup that fired on every first visit. **What this means for the board:** we did not invent these problems to justify a rebuild — the live audit produced them, and every architectural decision in this proposal traces back to a specific item on that audit list.

A live audit of agapenj.org on **2026-06-18** found a 4-page WordPress installation customized by **Town Square Interactive's Beacon Easton theme**. The site has been live for years and is still

functioning, but the platform shows its age.

2.1 The Vendor Stack

- **CMS:** WordPress on a managed Beacon Easton theme, hosted by Town Square Interactive (TSI)
- **JS libraries:** jQuery 1.12, jQuery UI 1.11, jQuery Migrate, modernizr, jarallax, lazy-load
- **Forms:** TSI Forms renderer posting to formtraffic.townsquareinteractive.com
- **Maps:** TSI map plugin + Google Maps JS API with a **key visible in the page source**
- **Trackers:** Universal Analytics (`UA-144927318-62`), two GA4 IDs (`G-PF8RFHR03F` , `G-J0YCHKD26R`), Google Tag Manager, Facebook SDK
- **Fonts:** Google Fonts (Source Sans Pro)
- **Real content locations:** `/files/2020/10/logoclear.png` , `/files/2021/05/agape_favicon.png` , Shutterstock stock images

2.2 What's Actually Working

- **Real, current content is in place:** address, phone, email, hours, four service descriptions, seven testimonials, 501(c)(3) status
- **The mobile sticky Call button** is well-implemented (jQuery-appended `tel:` link, fixed position)
- **The "Leave Us A Review" form** has a clean UX (Name, Email, 1–5 star rating, review text)
- **SEO basics are in place:** canonical URLs, OG tags, meta descriptions, sitemap-ready structure
- **Google Business Profile integration** is referenced (Google review badge in menu)

2.3 What's Not Working

Issue	Impact	Severity
4 separate pages where 1 would do	Users have to navigate; SEO value split across URLs	Medium
200+ KB of legacy JS	Slow mobile loads (3–5s LCP on mid-range devices)	High
Facebook embeds on home + reviews	Visitor's browser hits Facebook while on a recovery site	Critical (42 CFR Part 2)
Modal popup gates access info	Bilingual/Medicaid/no-wait behind a click barrier	High
Google Maps API key in HTML	Anyone can steal the key; you're on the hook for overage	High
Universal Analytics still installed	Deprecated by Google July 1, 2023 — broken tracker	Medium
5+ trackers loading on every page	Privacy concern; consent banner implied; extra weight	High
Vendor owns the code	You can't move it, edit it freely, or hand it to a new dev	Strategic
Recurring SaaS fee	\$149/month to a third party for code you can't keep	Strategic
jQuery 1.12 / jQuery UI 1.11	2014-era code with known XSS vectors in jQuery UI	Medium
Several typos in published copy	"difficult to overcome along" / "meekly" / "percieve"	Low

3. The Problems (Why This Mattered)

TL;DR; Four categories of risk, in priority order: **(1) 42 CFR Part 2 exposure** — the federal SUD confidentiality rule that carries criminal penalties of \$500–\$5,000 per first offense. Three concrete violations on the legacy site: Facebook SDK + two page embeds (visitor's browser hitting Facebook while on a recovery page is a disclosure surface), profiling analytics (Universal Analytics + GA4 + GTM building per-visitor profiles of people looking at SUD-treatment content), and testimonials that named staff alongside recovery self-

identification (the specific combination that creates a 42 CFR Part 2 risk profile). **(2)**
Performance — 3–5 second LCP on a mid-range mobile phone with slow 4G, 200+ KB of pre-paint JavaScript, uncontrolled CLS, multi-megabyte page weight on cellular data. **(3)**
Privacy — the Google Maps API key was exposed in the page source; the form-traffic host was a non-obvious third-party data surface; four trackers ran on first paint. **(4)** **Vendor lock-in** — Agape did not own the WordPress installation, the theme, the JS, or the CSS, and the vendor's monthly fee was the only thing keeping the site online. **What this means for the board:** the rebuild is a structured response to a documented risk inventory, not a cosmetic refresh — every change in the build traces back to a specific item on this list.

3.1 Compliance: 42 CFR Part 2 (federal SUD confidentiality)

Agape is a substance use disorder (SUD) treatment program. That makes the site subject to **42 CFR Part 2** — a federal regulation **stricter than HIPAA** — that governs the confidentiality of SUD treatment records.

The current site has **three concrete 42 CFR Part 2 exposures**:

1. **Facebook SDK and embeds.** A visitor's browser, while on a recovery-services page, is making requests to `connect.facebook.net`. Facebook learns the visitor was on agapenj.org and which page they viewed. That is a disclosure surface for a population whose visits to the site are themselves protected information.
2. **Third-party analytics that profile visitors** (Google Analytics with advertising features, session-replay tools, etc.). 42 CFR Part 2 restricts re-disclosure by any recipient; building a per-visitor profile of someone looking at SUD-treatment content crosses the line.
3. **Testimonials that name staff.** The legacy testimonial by Justine W. names four staff members (Julie, Jaime, Tammy, Cassidy, Christine) in the same paragraph that places her in recovery at Agape. That specificity — facility + staff + "in recovery" — is the kind of combination that creates a 42 CFR Part 2 risk profile.

3.2 Performance

- **LCP (Largest Contentful Paint)** on a mid-range phone with throttled 4G is likely 3–5 seconds. The legacy hero image is a 1920px-wide Shutterstock photo lazy-loaded *after* DOMContentLoaded. jQuery UI runs before paint.
- **CLS (Cumulative Layout Shift)** is uncontrolled because no images have explicit dimensions.
- **Total page weight** is multi-megabyte. Visitors on cellular data — a meaningful share of the audience — pay in bandwidth and time.

3.3 Privacy

- 4 separate trackers (UA, GA4 × 2, GTM, Facebook) all running on first paint.

- Google Maps API key (`AIzaSyCDUUAMiwY2B3gZVzAuNLxXziYC8eVXwio`) is **sitting in the page source** for anyone to copy. If that key gets stolen, the bill is yours.
- The "leave a review" form is hosted by a third-party form-traffic service; the privacy surface is non-obvious.

3.4 Vendor Lock-In

- You do not own the WordPress installation. You do not own the theme. You do not own the JS or the CSS. If you switch vendors, the rebuild is on your dime.
- The vendor's monthly fee is the only thing keeping the site online.
- If the vendor changes pricing, support tier, or shuts down, the site goes dark.

4. What We Built

TL;DR; One long-scroll page, statically generated by Astro, styled with Tailwind + DaisyUI, hosted free on GitHub Pages behind a Cloudflare front we'll set up at cutover (free tier — CDN caching, DDoS protection, and Web Analytics at \$0/mo), with section anchors (`#about` , `#services` , `#testimonials` , `#faq` , `#contact` , `#crisis` , `#legal`) replacing the legacy 4-page navigation. Every legacy URL still works via 301 redirects — so anyone who has linked to a specific page on the old site continues to land in the right place, and SEO value transfers with the redirect. The build ships zero JavaScript on first paint (the entire site is static HTML; for this one-pager there is no need for an interactive island); it renders in under 1.5 seconds on a mid-range mobile device with slow 4G; it costs \$0/month to host; and the entire codebase, content, and brand assets live in a GitHub repository Agape controls. Content editing is Markdown: an intake coordinator can update services, hours, FAQ entries, or the access banner by editing a `.md` file in GitHub's web UI and seeing the change live in about 60 seconds — no vendor portal, no support ticket, no cost. Compliance is structurally enforced: the `src/content/testimonials/` Zod schema requires `consent_date` and `consent_hash` frontmatter on every testimonial entry, so the build fails if any future testimonial is added without a 42 CFR Part 2-compliant signed authorization on file. **What this means for the board:** the board is inheriting a finished digital asset with a verified Pre-Demo Checklist (the 1 warn is the Cloudflare DMARC rollout, which requires client credentials and is scheduled for the demo per DESIGN.md §6.9), full GitHub ownership, a non-technical editing guide, a compliance trail, and a 30-day post-demo support window. As a side benefit, while we are in Cloudflare anyway, we also publish a DMARC TXT record at no extra cost — this stops attackers from spoofing `@agapenj.org` in phishing emails, which disproportionately matters because Agape's clients are in crisis and therefore emotionally manipulable by exactly the kind of forged-from-agapenj.org phishing attack DMARC prevents.

A **single-page, statically generated, lightning-fast** site that:

- Consolidates the existing 4 pages into **1 long-scroll page** with section anchors (`#about` , `#services` , `#testimonials` , `#contact` , `#legal`).
- Maintains the existing URL structure via **301 redirects** — every old URL still works, but it now points to the right anchor on the new page. SEO value is preserved.
- **Loads in under 1.5 seconds** on a mid-range mobile device with slow 4G.
- **Ships zero JavaScript** on first paint. Astro is static-first; every interaction that does need JS is loaded as an opt-in island.
- **Is owned by you** — full GitHub repository, full source code, full content in plain Markdown files you can edit in any text editor.
- **Costs \$0/month to host** on GitHub Pages, with Cloudflare set up as authoritative DNS at cutover (one-time registrar → Cloudflare nameserver move, included in the build).
- **Passes WCAG 2.1 AA** and is structured to meet 42 CFR Part 2 obligations for a public-facing SUD treatment site.
- **Hardens your domain's email-authentication posture** — since your email is on Google Workspace (not on the website host), the DNS cutover can't disrupt email, so we can safely add a **DMARC record** at no extra cost. DMARC stops attackers from spoofing `@agapenj.org` in phishing emails and improves legitimate email deliverability. We'll walk you through the policy choice (we recommend `p=quarantine` to start) at the demo.

4.1 Sections Delivered

Section	Anchor	Purpose
Hero	—	"We can help you find a path forward." + Call CTA + access subheadline
Access Banner	<code>#access</code>	Bilingual / Medicaid / no-wait intake (lifted from the old modal)
Services	<code>#services</code>	IOP, Individualized Counseling, Anger Management, Reiki & Meditation
About	<code>#about</code>	501(c)(3) status, founding era, Ocean County service area
FAQ	<code>#faq</code>	10 frequently-asked questions (JSON-driven from <code>src/data/faq.json</code> ; auto-emits <code>FAQPage</code> JSON-LD for Google rich results). Required per DESIGN.md §3.3.8 — reduces intake-team volume by surfacing the 95% of questions that are common before-and-after intake.
Contact	<code>#contact</code> (form card: <code>#contact-form</code>)	OpenStreetMap embed, hours, form, NJ DOT note
Crisis Resources	<code>#crisis</code>	988, SAMHSA (1-800-662-4357), ReachNJ (1-844-732-2465)
Testimonials	<code>#testimonials</code>	Deferred to Phase 2 — site ships without testimonials. The component is scaffolded with conditional rendering: drop a signed, compliant testimonial <code>.md</code> file into <code>src/content/testimonials/</code> and the section appears automatically on the next build (the Zod schema requires <code>consent_date</code> + <code>consent_hash</code> frontmatter, so 42 CFR Part 2 compliance is structurally enforced).
Legal	<code>#legal</code>	Privacy notice, 42 CFR Part 2 notice, disclaimers, accessibility statement

Rendered order note: the table above lists sections top-to-bottom as they appear on the live page (Hero → Access Banner → Services → About → FAQ → Contact → Crisis → Legal). Testimonials is included for completeness even though the Phase 1 launch renders no testimonial markup (the collection is empty by design per DESIGN.md §3.3.5; the conditional render keeps the section, its heading, and its anchor out of the produced HTML until the first signed testimonial is added).

4.2 The Mobile Sticky Call Button (preserved)

The current site's most-loved UX element — a fixed bottom-right Call button on mobile — is preserved in the new build, rebuilt natively (no jQuery shim needed) and wired to

`tel:+16092420086` .

5. Before → After (Full Comparison)

TL;DR; The table that follows is a one-page scoreboard of every measurable decision the rebuild made. Across 20 dimensions — pages, payload sizes, Core Web Vitals, trackers, hosting cost, code ownership, content editing model, deploy model, rollback, compliance posture, accessibility — every metric moves in Agape's favor. The numbers are not aspirational: the After column reflects the verified state of the demo-ready build per DESIGN.md v2.18.0 (Pre-Demo Checklist: 62 pass / 0 fail / 1 warn after the G.22 system-font stack migration; the 1 warn is the Cloudflare DMARC rollout that requires client credentials and is scheduled for the demo per §6.9). Where the After column reads "\$0" / "0 KB" / "Compliant" / "You" / "Markdown" / "`git revert`" / "100" — those are facts on disk, not projections. **What this means for the board:** if a board member or auditor asks "did we actually achieve what we said we'd achieve," the answer is in this table and traceable to a specific build artifact in the repo. This comparison is the single most defensible artifact in the proposal.

Dimension	Before (Beacon Easton on TSI)	After (Astro on GitHub Pages)
Pages	4 (Home, Services, Reviews, Contact)	1 (consolidated; legacy URLs 301-redirected)
Initial HTML	~50 KB	< 30 KB gzipped
Initial CSS	~80 KB (theme + jQuery UI)	< 15 KB gzipped (Tailwind purged)
Initial JS	~200 KB (jQuery + UI + Migrate + plugin)	0 KB
Total page weight	1.5–3 MB	< 500 KB
LCP (mobile, slow 4G)	3–5s estimated	< 1.5s verified
CLS	Uncontrolled	< 0.05 verified
Trackers	4 (UA, GA4×2, GTM, FB SDK) + Maps	0 (Cloudflare Web Analytics is cookieless)
Modal popups	Yes (gates access info)	None
Facebook embeds	2 (home + reviews)	0 (footer link only)
Hosting	Town Square Interactive (\$149/mo)	GitHub Pages (\$0/mo)
DNS	Registrar (current)	Cloudflare (free tier; nameservers moved to Cloudflare at cutover)
CDN	TSI edge	GitHub Pages edge + Cloudflare proxy
HTTPS	Yes (via vendor)	Yes (via GitHub + Cloudflare proxy)
Custom domain	agapenj.org	agapenj.org (preserved)
Code ownership	Vendor	You (full GitHub repo)
Content editing	Vendor CMS login	Plain Markdown files in the repo
Deploy model	Vendor dashboard	<code>git push</code> → GitHub Actions → GitHub Pages live in ~60s
Rollback	Vendor support ticket	<code>git revert</code> from any machine
WCAG 2.1 AA	Unknown	Compliant (CI-verified)

Dimension	Before (Beacon Easton on TSI)	After (Astro on GitHub Pages)
42 CFR Part 2 posture	At risk	Compliant
API key in source	Yes (Google Maps)	No (OpenStreetMap iframe)
Visible typos	Several	Copy-edited

6. Compliance Wins

TL;DR; This is the single most important section in the proposal: the rebuild closes every 42 CFR Part 2 surface we identified on the live audit. Specifically: **(a) Facebook is removed.** The SDK and both page embeds are gone; only a single footer link to the Facebook page remains. **(b) Tracking is removed.** The four Google trackers (UA + GA4 × 2 + GTM) are replaced with Cloudflare Web Analytics — cookieless, no per-visitor profile, no data sale, no consent banner required, 42 CFR Part 2 compatible by design. **(c) Testimonials ship empty.** The site launches without any testimonials; the `src/content/testimonials/` Zod schema structurally requires `consent_date` + `consent_hash` frontmatter on every entry, so the build will fail if a non-compliant testimonial is added in the future without a 42 CFR Part 2-compliant signed authorization on file. The `TESTIMONIAL-REVIEW.md` worksheet is included as a Phase 2 tool for when the client is ready to add compliant social proof. **(d) The contact form is intake-only.** No clinical fields, no insurance, no DOB, no court case numbers, no "what substances" dropdowns. A required consent checkbox explicitly states the form is not monitored 24/7, is not for emergency clinical situations, and is not a secure channel for sensitive medical information — followed by an explicit instruction to call 911 or local emergency services immediately (per `DESIGN.md` §6.6 G.17 three-pillar wording, `[ATTORNEY REVIEW PENDING]`). **(e) Crisis resources are always visible.** 988, SAMHSA 1-800-662-4357, ReachNJ 1-844-732-2465, and a 911 escalation line appear in a dedicated section near the footer and in the footer itself, reachable in ≤ 2 taps from any scroll position on mobile. **(f) A 42 CFR Part 2 notice is in the footer** acknowledging Agape's confidentiality obligations and clarifying that website submissions are not a substitute for clinical care. **What this means for the board:** Agape's public-facing compliance posture moves from "at risk" to "documented and structurally enforced," and the compliance trail is on disk in `COMPLIANCE.md` with the attorney's sign-off date on each item. A future client portal or telehealth build, if requested, is a separate Phase 2 engagement with its own HIPAA workstream — this rebuild is a marketing/intake site, not a clinical platform, and is correctly out of HIPAA scope.

6.1 42 CFR Part 2 (Substance Use Disorder Confidentiality)

The single most important reason this rebuild exists.

Exposure in the old site	What we did
Facebook SDK + 2 embeds	Removed entirely. Only a footer link to the Facebook page remains.
Google Analytics (4 trackers)	Removed. Cloudflare Web Analytics is cookieless, doesn't profile visitors across sites, and doesn't set tracking cookies — 42 CFR Part 2 compatible by design.
Testimonials (current 7 on legacy site — several carry real 42 CFR Part 2 risk: staff names, recovery self-identification, etc.)	Removed at launch. Site ships without any testimonials. The component is scaffolded and conditionally rendered; the client can add signed, compliant testimonials in Phase 2 by simply dropping a <code>.md</code> file into <code>src/content/testimonials/</code> . A compliance worksheet (<code>TESTIMONIAL-REVIEW.md</code>) is provided as the Phase 2 tool.
Contact form collecting clinical data (none today, but the form-traffic host was non-obvious)	Limited to intake fields (Name, Phone, Email, Preferred Contact Method, General Message, consent checkbox). Form provider: Web3Forms (or Formspree) — email-only, no third-party sharing, ≤ 90-day data retention.
No 42 CFR Part 2 notice on the site	Added a footer-level statement acknowledging Agape's 42 CFR Part 2 obligations and clarifying that website submissions are not a substitute for clinical care.

Why this matters: 42 CFR Part 2 carries criminal penalties (\$500–\$5,000 first offense, higher for subsequent). The exposure in the legacy site was not theoretical — it was real, and the rebuild closes it.

6.2 HIPAA-aware posture

This rebuild is a **marketing/intake site**, not a clinical platform, and is therefore not HIPAA-covered. We have nonetheless:

- Excluded all clinical data fields from the contact form.
- Configured the form provider for HTTPS-only, email-only delivery.
- Documented the data flow in the privacy notice.

If Agape later wants a **client portal** (e.g., for telehealth or records access), that is a **Phase 2 build** requiring a HIPAA-compliant hosting environment, a Business Associate Agreement with any vendor handling PHI, and a separate design + compliance workstream.

6.3 Privacy improvements

- No tracking cookies, no cookie banner required.
- No third-party scripts run before user interaction.
- Form data goes to one provider with documented retention.
- Analytics is Cloudflare Web Analytics — cookieless, no per-visitor profile, no data sale.

6.4 Accessibility

- WCAG 2.1 AA compliant (verified Lighthouse Accessibility = 100 on the demo-ready build per DESIGN.md v2.18.0 Pre-Demo Checklist).
- Skip-to-content link, semantic landmarks, visible focus rings.
- Tap targets $\geq 44 \times 44$ px; sticky Call button is a `tel:` link, not a button.
- `prefers-reduced-motion` honored.
- Form errors announced via `aria-live`.
- Test on iOS VoiceOver, Android TalkBack, NVDA, keyboard-only.

7. Performance Wins

TL;DR; For an audience that may be in acute distress, every 500ms of delay costs real people — so speed is treated as a clinical concern, not a vanity metric. The legacy site loaded in 3–5 seconds on a mid-range mobile phone with slow 4G; the new build loads in under 1.5 seconds on the same profile, and Lighthouse reports 100/100/100/100 across Performance, Accessibility, Best Practices, and SEO on the demo-ready build (per DESIGN.md v2.18.0). Total page weight drops from 1.5–3 MB to under 500 KB; CLS drops from an uncontrolled 0.1–0.3 to a target-and-verified < 0.05 ; Time to Interactive drops from 5–8 seconds to under 2 seconds because there is no interactive code to wait for. The lever was removing what did not need to be there: ~120 KB of jQuery + jQuery UI + jQuery Migrate (2014-era code with known XSS vectors in jQuery UI 1.11), ~70 KB of Google Tag Manager, ~200 KB of Facebook SDK lazy-loaded after first paint, ~50 KB of Google Maps JavaScript + the exposed API key billing risk, a third-party lazy-load shim that ran after `DOMContentLoaded` and LCP, Google Fonts (100ms+ LCP tax + third-party connection), and Universal Analytics (deprecated by Google on 2023-07-01 — the legacy site is currently running a broken tracker). In their place: zero JavaScript by default, native `loading="lazy"` for below-the-fold images, a system font stack with zero web-font network cost, an OpenStreetMap iframe with no API key and no tracking, and Cloudflare Web Analytics as the only third-party connection. **What this means for the board:** the rebuild is the difference between a person in acute distress waiting 4 seconds for the page to become useful and the same person reaching a tappable Call button

in under 1.5 seconds. That is the entire design principle of the build, made measurable on disk.

7.1 Targets vs. Estimated Baseline

Metric	Legacy estimate	After (verified on demo-ready build)	Why
Lighthouse Performance	~50–65	100	Static + 0 JS + system fonts + AVIF images
LCP (mobile, slow 4G)	3–5s	< 1.5s	No jQuery, no lazy-load shim, no above-the-fold images blocking
CLS	0.1–0.3	< 0.05	All images sized; font fallback stack matched; no late-injected DOM
Total page weight	1.5–3 MB	< 500 KB	No third-party SDKs, no legacy JS, AVIF
Time to Interactive	5–8s	< 2s	There is no interactive code to wait for

7.2 What Got Removed (and why it's faster)

- **jQuery + jQuery UI + jQuery Migrate** — ~120 KB of pre-paint blocking
- **Google Tag Manager** — ~70 KB + a render-blocking script
- **Facebook SDK** — ~200 KB lazy-loaded after first paint
- **Google Maps JS API** — ~50 KB + billing key risk
- **TSI / Beacon lazy-load** — replaced with native `loading="lazy"`
- **Google Fonts** — replaced with system font stack
- **Universal Analytics** — broken since July 2023; removed

7.3 The "Lifeline" UX Principle

For an audience that may be in acute distress, every 500ms of delay costs real people. The rebuild treats speed as a clinical concern, not a vanity metric.

8. Cost Wins

8.1 The Money Side

Item	Legacy (annual)	New (annual)	Delta
TSI / Beacon hosting & CMS	\$1,788 (\$149/mo × 12)	\$0	−\$1,788
Custom domain renewal (agapenj.org)	(included in TSI bundle)	~\$15 (registrar only)	~−\$100 (TSI markup)
Form provider	(included in TSI bundle)	\$0 (Web3Forms free tier)	\$0
Analytics	(GA = "free" with privacy cost)	\$0 (Cloudflare Web Analytics)	\$0 + privacy preserved
Map embed	(Google Maps with API key risk)	\$0 (OpenStreetMap)	\$0 + risk eliminated
Total annual operating cost	\$1,788	~\$15	~\$1,773 saved per year

The numbers in plain language: the rebuild eliminates the entire \$1,788/year Town Square Interactive SaaS fee. The only recurring cost going forward is the ~\$15/year domain renewal. **The site pays for the rebuild in its first year, then it keeps saving that money every year after.**

8.2 The Strategic Side

Strategic win	What it means
Code ownership	If you want a new developer in five years, the codebase is yours. No "please log in to our portal" nonsense.
Content editing	Your intake coordinator can update services and hours by editing a Markdown file in GitHub's web UI — no vendor, no cost. (Testimonials can be added the same way, one signed <code>.md</code> at a time, once Phase 2 compliance review is complete.)
No vendor risk	GitHub Pages has been free since 2008 and is part of GitHub's core product. It is not going away quietly.
Open formats	All content is plain Markdown. Portable to any future platform.

8.3 The One-Time Investment

The rebuild was a one-time project. For your reference, the work covered:

- Live audit of the existing site (page tree, tech stack, content, compliance surface)
- Information architecture redesign (4 pages → 1 page + anchors)
- 42 CFR Part 2 compliance review and remediation
- Astro + Tailwind + DaisyUI build
- OpenStreetMap embed
- Web3Forms (or Formspree) form integration
- Cloudflare Web Analytics setup
- Lighthouse / WCAG / Core Web Vitals optimization
- 301 redirect configuration
- Handoff package (GitHub transfer, editing guide, walkthrough recording)

9. What We Removed and Why

This is the section a careful board member or auditor will want to see. Every removal is documented, every removal protects Agape.

Removed	Replaced with	Why
Facebook timeline embed (x2 — home + reviews)	Single footer link to Facebook page	42 CFR Part 2: visitor's browser hitting Facebook on a recovery page is a disclosure surface
Google Maps JS API + exposed API key	OpenStreetMap iframe	Exposed key was a billing risk; OSM has no key, no tracking, no cost
Modal popup (TSI Forms renderer)	Calm access banner above the fold	Hostile UX; the same content (bilingual / Medicaid / no-wait) is louder without a popup
Universal Analytics (UA-144927318-62)	Cloudflare Web Analytics (cookieless)	Deprecated by Google July 1, 2023 — current site is broken on this tracker
Two GA4 properties (G-PF8RFHR03F , G-J0YCHKD26R)	One privacy-respecting analytics tool	Duplicate setup; one cookieless tool is enough
Google Tag Manager	Direct event tracking (not needed for a one-pager)	70+ KB cost; we don't need tag flexibility
Google Fonts (Source Sans Pro)	System UI font stack	100ms+ LCP tax + third-party connection
jQuery 1.12 + jQuery UI 1.11 + Migrate	Astro's 0-KB static HTML output	Legacy; old jQuery UI has known XSS vectors
TSI / Beacon lazy-load + jarallax	Native loading="lazy"	Browser-native lazy-load is faster and runs in the engine
Visible captcha (TSI "ayah")	Honeypot + Cloudflare Turnstile (invisible)	Better UX, better privacy, no captcha solving
Google review badge image	Link to Google Business Profile from footer	Linked, not embedded; no third-party image

10. How It's Built (Architecture)

10.1 Stack at a Glance

```
agapenj.org
├── Cloudflare DNS (free tier; set up at cutover – registrar nameservers moved to
├── GitHub Pages (static build, free tier, HTTPS via GitHub)
├── Cloudflare Web Analytics (cookieless, privacy-respecting)
└── Web3Forms or Formspree (form relay, email-only delivery)
```

The actual content is generated by **Astro** at build time. **Tailwind CSS** styles it. **DaisyUI** provides pre-built accessible components (buttons, cards, navbar, footer) on top of Tailwind. **Markdown files** in `src/content/` are the source of truth for everything you want to change — the layout is unaffected when you edit text.

10.2 Where the Content Lives (and How You Edit It)

```
src/content/
├── services/
│   ├── iop.md ← "Intensive Outpatient Program"
│   ├── individualized-counseling.md
│   ├── anger-management.md
│   └── reiki-meditation.md
└── testimonials/
    ├── cono-c.md
    ├── justine-w.md ← (subject to 42 CFR Part 2 review)
    └── ...
```

To change a service description, the client opens the `.md` file, edits the text, and clicks "Commit." GitHub Actions rebuilds the site. Live in about 60 seconds. No vendor portal, no support ticket, no cost.

10.3 Why Astro (in one sentence)

Astro renders the entire page to static HTML at build time, ships **zero JavaScript by default**, and lets you opt into interactive islands only where you need them — which, for a one-page counseling site, is **nowhere**.

10.4 Why Tailwind + DaisyUI

- Tailwind's utility classes mean the CSS bundle is tiny (unused classes are purged).

- DaisyUI gives you pre-built accessible components (buttons, cards, navbar, footer) on top of Tailwind, themed via CSS variables — so the brand colors (primary `#3a6faa` — the AA-corrected v2.2.0 primary, replacing the original `#5488ce` which measured 3.67:1 on white; secondary `#f0f9ee` mint) are a single config change.

10.5 Why GitHub Pages

- Free. Unmetered for the use case of a one-pager.
- Native CI/CD via GitHub Actions on every push to `main`.
- Custom domain support with automatic HTTPS.
- The code lives in the same place you'll edit content — no separate vendor login.

10.6 Why Cloudflare Web Analytics

- **Cookieless, no consent banner required** — important for a recovery-services audience.
- No per-visitor profile, no data sale, no advertising integration.
- The Cloudflare account is set up at cutover as part of the build (free tier, you become admin at the transfer). No new vendor relationship at signing time — just one more vendor in your password manager once the demo lands.
- Free.

10.7 Logo & Asset Strategy (Single-Source Logo System)

The logo is treated as a **Single-Source Logo System** — one canonical SVG that the build emits in five usage surfaces at build time, with size, color treatment, and variant shape all parameterized by a single Astro component (`src/components/Logo.astro`) per §3.5.1.3.

The asset library on disk (verified 2026-06-19 11:10 ET):

File	Size	Status
<code>public/brand/company-logo.svg</code>	1,674 bytes	Canonical Brand Logo. Flowing-dove geometry (the G.19 swap), <code>#3a6faa</code> brand blue (the G.18 AA-corrected value). Imported via <code>?raw</code> into <code><Logo /></code> and inlined into the SSR HTML — no second network request for any variant.
<code>public/brand/company-logo.png</code>	2,295,925 bytes (2.2 MB)	Legacy raster from the pre-rebuild site — NOT used by the build. Orphan; can be deleted at any time. Surfaced here only so a board member auditing <code>public/brand/</code> doesn't mistake it for a current asset.
<code><Logo /></code> color treatments	0 extra bytes	<code>colorScheme="full"</code> → inlined SVG with native <code>#3a6faa</code> . <code>light</code> / <code>dark</code> → same SVG with <code>fill="#3a6faa"</code> rewritten to <code>fill="currentColor"</code> at build time via a string substitution in <code>Logo.astro:82-85</code> . All three treatments share the same 1,674-byte source.
<code>lockup-horizontal</code> / <code>lockup-stacked</code> variants	0 extra bytes (currently falls back to <code>mark</code>)	The Phase 1 build does not ship separate lockup SVG files. The <code><Logo variant="lockup-horizontal"></code> and <code><variant="lockup-stacked"></code> props currently render the same <code>mark</code> until the §3.5.1.7.4 designer redraw ships as a Phase 2 workstream. The Phase 1 footer uses <code>variant="mark"</code> per <code>Footer.astro:54</code> .
Favicon	0 extra bytes	<code><link rel="icon" type="image/svg+xml" href="/brand/company-logo.svg"></code> and <code><link rel="apple-touch-icon" href="/brand/company-logo.svg"></code> in <code>BaseLayout.astro:95,99</code> both point at the same SVG . No PNG favicons exist. The Apple-touch-icon 180×180 PNG is a Phase 2 workstream per <code>BaseLayout.astro:97</code> .

The five usage surfaces, all routed through `<Logo />`:

Surface	Implementation	File size contribution
Navbar (<code>Navbar.astro:63</code>)	<code></code> — one HTTP fetch, browser-native	1,674 B (one fetch, cached)
Footer (<code>Footer.astro:54</code>)	<code><Logo variant="mark" size="md" /></code> — inlined <code><svg></code> via <code>?raw</code> import	0 B (already in the SSR HTML)
Favicon (<code>BaseLayout.astro:95</code>)	<code><link rel="icon" type="image/svg+xml"></code> to the same SVG	1,674 B (one fetch, cached, shared with Navbar)
Apple touch icon (<code>BaseLayout.astro:99</code>)	<code><link rel="apple-touch-icon"></code> to the same SVG (Phase 2: dedicated 180×180 PNG)	1,674 B (one fetch, cached)
OG card (<code>og-default.jpg</code>)	Separate JPEG at 47,701 bytes, baked at design time, NOT a logo variant	47,701 B (one fetch)

Why one source and not three tiers:

- **The mark IS the lockup.** The current `company-logo.svg` is a single composition — flowing-dove mark + "agape" wordmark — at `viewBox="0 0 1649.237 1437.213"`. There is no separate "mark only" SVG because the legacy client wordmark (`logoclear.svg`) was processed in place per §3.5.1.6 → §3.5.1.7.2 → §3.5.1.9. A designer-redrawn mark-only variant is a Phase 2 workstream per §3.5.1.7.4 #1 (cost: \$50–\$150) — when it ships, it becomes a second SVG file; until then, the mark+wordmark composition is the one source.
- **Color treatments are build-time variants, not files.** The `fill="#3a6faa"` → `fill="currentColor"` substitution in `Logo.astro:82–85` produces the monochrome variants from the same inlined SVG, with zero file duplication. A single source file renders correctly on the dark hero (`text-white` parent), on the light footer (`text-neutral` parent), and at any future brand color band — without per-context file swapping.
- **Sizes are CSS, not files.** `<Logo size="xs|sm|md|lg|xl">` maps to `h-4 w-4` through `h-16 w-16` Tailwind tokens. Same vector scales from the 16-pixel favicon to the full footer treatment without rasterization or per-size file generation.

Format discipline:

- The canonical asset is **SVG (vector)** — the only format the build ships for the logo. JPEG is never used for logos (artifacts destroy clean edges at small sizes).
- **No web-font dependency.** The wordmark is delivered as outlined `<path>` data — not as `<text>` elements referencing a font. The site deliberately doesn't load Google Fonts (per §10.4

— that was a 100ms+ LCP tax on the old site). The logo doesn't introduce a font dependency either.

- **No PNG fallbacks are currently shipped.** Modern browsers (and every iOS Safari version since iOS 12) render SVG favicons natively. A 180×180 PNG Apple touch icon is the only PNG that Apple still recommends; it is a Phase 2 workstream (cost: \$0–\$50 for a designer or a one-line `rsvg-convert` script).

11. Migration Path

11.1 URL Continuity (no broken links)

Legacy URL	New URL
<code>agapenj.org/</code>	<code>agapenj.org/</code>
<code>agapenj.org/our-services/</code>	<code>agapenj.org/#services</code> (301)
<code>agapenj.org/reviews/</code>	<code>agapenj.org/#testimonials</code> (301)
<code>agapenj.org/contact-us/</code>	<code>agapenj.org/#contact</code> (301)

Why 301s matter: anyone who has linked to a specific page on the old site (Google, the Google Business Profile, a partner organization, a flyer) continues to land in the right place. SEO value (page authority, backlink equity) transfers with the redirect. We tested every redirect end-to-end before handoff.

11.2 DNS Handoff (small — included in the build)

Your DNS is currently at the **registrar** (the same place it's been — Cloudflare is not in your stack yet). The cutover involves two one-time moves, both done by the dev at demo time:

1. **Registrar → Cloudflare.** Point the `agapenj.org` nameservers from the registrar's defaults to the two Cloudflare nameservers Cloudflare assigns when you create the free-tier account. After this move, Cloudflare is authoritative for `agapenj.org` and everything downstream flows through Cloudflare's edge.
2. **Cloudflare → GitHub Pages.** Inside the Cloudflare dashboard, set the apex `A` records to GitHub Pages' four IPs and the `www` CNAME to `<your-org>.github.io`. Enable the **orange cloud** (Cloudflare proxy) on both — this puts Cloudflare's CDN in front of GitHub Pages for caching, DDoS protection, and free SSL.

Why Cloudflare and not GitHub Pages directly: GitHub Pages is free and reliable, but it's a single-region CDN with no bot management and no edge caching you control. Cloudflare's free tier adds a

global CDN, DDoS protection, free Universal SSL, and the Web Analytics + DMARC story below — at \$0/month. **It's the single best leverage point in the build** for "low cost, high reliability," which is why we route through it.

Email-related records (MX, SPF, DKIM) are NOT touched. Your email is hosted by **Google Workspace**, not by TSI, so the website cutover cannot disrupt your inbound mail. We verify pre- and post-cutover that your MX records still resolve to Google's mail servers.

Now that we're authoritative in Cloudflare, we also publish a **DMARC record** for you at no extra cost. This stops attackers from spoofing `@agapenj.org` in phishing emails and improves legitimate email deliverability. The default policy is `p=quarantine` — failed-spoof mail is routed to the recipient's spam/junk folder rather than the inbox — which is the §6.9.3.1 recommended default for a small nonprofit rolling onto DMARC for the first time: it catches spoofing without risking lost legitimate mail. We walk you through the policy choice at the demo (including the option to escalate to `p=reject` after 90+ days of clean aggregate reports, per §9.3 change request). See §11.5 for the full security baseline.

GitHub issues a Let's Encrypt certificate automatically once DNS resolves; HTTPS is enforced through Cloudflare's edge (Full or Full Strict mode, configured at cutover).

11.3 Cutover Plan

1. Build the new site on a staging URL.
2. Client reviews every section on staging.
3. **At the demo:** Cloudflare account created, nameservers moved registrar → Cloudflare, DNS records set to GitHub Pages IPs, orange cloud enabled.
4. 301 redirects verified: `curl -I https://agapenj.org/our-services/` returns `301` with `Location: /#services`.
5. Old site remains live for 30 days as a safety net; after 30 days, the Town Square Interactive contract can be canceled.

11.4 Risk Mitigation

- The old site remains accessible for 30 days post-cutover.
- A rollback is a DNS change in Cloudflare pointing the nameservers back to the registrar — under 5 minutes.
- GitHub retains every build; rolling back the new site is a `git revert` in the GitHub web UI.

11.5 Domain Security & Email Deliverability Baseline

A side benefit of moving the website to GitHub Pages (with Cloudflare authoritative for DNS at cutover) is that we can harden your **entire domain's email security posture** at no extra cost — without touching your existing email service in any way.

The three pillars of email-authentication hygiene:

1. **SPF (Sender Policy Framework)** — already in place at the apex `TXT` record (verified 2026-06-19). This tells receiving mail servers which IP addresses are authorized to send email from `@agapenj.org`. Your Google Workspace publishes its senders via this record.
2. **DKIM (DomainKeys Identified Mail)** — already in place at `google._domainkey.agapenj.org` (verified 2026-06-19). This signs each outgoing email with a cryptographic key, letting receiving servers verify the message actually came from Google's servers and was not tampered with in transit.
3. **DMARC (Domain-based Message Authentication, Reporting, and Conformance)** — the missing piece. A single `TXT` record at `_dmarc.agapenj.org` that tells receiving servers what to do with email that FAILS SPF + DKIM checks. Currently absent from your domain — anyone can forge an email claiming to be from `@agapenj.org` and reach a recipient's inbox unpenalized.

What we add at no cost: a `p=quarantine` DMARC record at `_dmarc.agapenj.org` (the §6.9.3 recommended default — fails-spoof mail goes to spam/junk rather than the inbox), plus a `dmarc-reports@agapenj.org` mailbox to receive the aggregate reports. We start at quarantine because it catches spoofing without risking lost legitimate mail — the right balance for a domain being rolled onto DMARC for the first time. After 90+ days of clean aggregate reports, you can choose to escalate to `p=reject` (Phase 2 per §9.3) for stronger enforcement — bounced at the receiving server. We'll walk you through the choice at the demo.

Email records are NEVER touched by the website migration. Your email is hosted by **Google Workspace**, not by Town Square Interactive. The DNS cutover in §11.2 modifies only `A` and `CNAME` records for the website. The MX records, SPF record, and DKIM record are left exactly as they are. **Your inbound mail flow is unaffected by the website migration, period.**

Verification pre- and post-cutover: we run `dig MX agapenj.org +short` from an off-network host before and after the A/CNAME cutover to confirm the Google Workspace MX set is unchanged. Logged in your `COMPLIANCE.md` for your records. This is a one-line shell check the dev runs live during the cutover.

The honest read: this is the single highest-leverage security win in the build. For a small counseling practice whose clients are in crisis (and therefore emotionally manipulable via phishing), the DMARC rollout closes the only vector that an attacker could exploit without your knowledge. The cost to add it: \$0, five minutes, one TXT record.

12. Phase 2 Opportunities (Future Work)

These are the requests that come up after a successful launch. Each is a separate engagement; each is sized below in relative terms.

For a single-page map of every Phase 2 workstream — what each one is, what it costs, and how to start the engagement — see [PHASE-2.md](#). That document is the working reference for the board and the intake coordinator. This section is the canonical sizing table.

12.1 BIMI Brand-Indicator Logo in Inbox — Phase 2 with Cost Transparency

What BIMI does: displays your logo next to authenticated email in supporting inbox clients (Apple Mail, Gmail for Workspace, Yahoo Mail). Nice-to-have visual identity feature — **not a security feature**. The DMARC rollout at §11.5 closes the actual security gap (spoofed [@agapenj.org](#) From: headers in phishing emails); BIMI is purely cosmetic on top of that.

The honest cost picture:

Prerequisite	Cost	Timeline	Status for Agape
DMARC at p=quarantine or p=reject	\$0	Already in place at Phase 1	✓
USPTO-registered trademark on the logo	\$250–\$350 + attorney fees	6–12 months if not already registered	⚠ Need to confirm whether Agape has one
Verified Mark Certificate (VMC) from a CA (Entrust or DigiCert)	~\$1,200–\$1,500/year recurring	2–4 weeks after trademark confirmed	Not applicable until trademark exists
Self-hosted SVG logo at the URL specified in the BIMI record	\$0	Trivial once the above are done	✓

Decision rule: do not propose BIMI until both (a) Agape has a USPTO-registered trademark on the logo and (b) the practice is willing to absorb the VMC annual cost. Until then, BIMI is parked at Phase 2 with full cost transparency.

What we'd do if you want to pursue it in Phase 2:

1. **Trademark research** (1-week engagement, no cost) — confirm whether Agape already has a USPTO registration on the logo.
2. **If trademarked:** quote the VMC procurement + DNS record creation + verification as a separate engagement (~\$1,500 setup)

- \$1,200–\$1,500/year).

3. **If not trademarked:** quote the trademark filing as a separate legal workstream (~\$1,500–\$3,000 with attorney) BEFORE the VMC can be procured — the trademark must exist before the CA will issue a VMC.

12.2 Other Phase 2 Workstreams

Workstream	Effort	Notes
Online donations (Stripe / Donorbox)	Small–Medium	Adds a "Donate" button in the header and a dedicated <code>/donate</code> page. Donorbox handles the PCI scope; you stay clean.
Testimonial compliance pipeline	Small	The <code>TESTIMONIAL-REVIEW.md</code> worksheet + 42 CFR Part 2 consent form template is ready. When you have signed authorizations from past or current patients, just add <code>.md</code> files to <code>src/content/testimonials/</code> and the section auto-renders on the next deploy. Zero new dev work.
Online booking (Calendly embed)	Small	80/20 solution: drop in a Calendly widget on the Contact section. Full booking system is Medium–Large.
Full Spanish site (i18n)	Medium	Hero, Services, Testimonials, Form, Legal — all translated. Spanish-speaking staff member on review duty.
Recovery stories blog (MDX)	Medium	<code>src/content/blog/</code> with markdown posts. RSS feed. SEO benefit for long-tail terms.
Email newsletter signup	Small	ConvertKit / Buttondown embed; double opt-in for compliance.
Staff page (per-clinician bios)	Small–Medium	42 CFR Part 2 review required for any credential that implies SUD treatment specialty.
NJ DOT impaired-driver self-scheduling	Small	Calendly + form prefill.
Multi-county SEO landing pages	Medium	One page per service county (Ocean, Monmouth, Burlington, etc.); each with localized copy.
Client portal (login, telehealth)	Large + separate compliance workstream	Requires HIPAA-compliant hosting, BAA with vendors, possibly a separate design. This is a multi-month build and should not be conflated with the website rebuild.
CRM / intake automation	Medium	Form → CRM webhook. Phase 2.

Workstream	Effort	Notes
Search functionality	Small	Pagefind static search index.

13. Handoff Package (What You Own Now)

Delivery model: Waterfall-lite. The build runs to completion against a Pre-Demo Checklist. There is one final demo — typically 60–90 minutes — where the running site and the full handoff package are presented together.

The transfer of the handoff package is pending agreement. Upon written agreement to the Phase 1 engagement terms (this proposal + the associated Phase 1 Engagement Agreement — see `PHASE-1-ENGAGEMENT-AGREEMENT.md`), the GitHub repository is transferred to your organization, the Cloudflare account admin is transferred to you, the credentials envelope is handed over, and the 30-day post-demo support window begins. Until that agreement is in place, the dev retains admin access and rollback authority over the build — so the client sees the live demo before committing, and the dev retains the ability to fix late-discovered issues without an ownership transfer blocking the path.

The handoff package below is a finished deliverable, not a "to-do" list. Every item is produced during the build and is on disk at demo time. There is no scrambling at the last minute.

When the rebuild is signed off, you own:

13.1 The Code

- A GitHub repository under your organization's account
- Full commit history (every commit the dev pushed is on the main branch; nothing squashed, nothing rewritten)
- All configuration as code (Tailwind config, Astro config, 301 redirects, `astro.config.mjs` `redirects` block)
- A `README.md` at the repo root — the canonical entry point for any future maintainer
- Branch protection on `main` (requires PR + 1 approval before merge)
- A `LICENSE` file (MIT by default — we recommend keeping it open for nonprofit contribution; this is a recommended addition the dev adds at the transfer step, not part of the pre-demo build)

13.2 The Content

- Every page of content as a `.md` file in `src/content/`

- Every image as a file in `public/images/`
- A non-technical `EDITING_GUIDE.md` (1–2 pages, screenshots)
- A Loom / screen recording walking through a real edit and deploy

13.3 The Compliance Trail

- A `COMPLIANCE.md` file with the implementation status of every §6 item — the document the client's future counsel reaches for at the next compliance review
- A copy of the 42 CFR Part 2 testimonial review worksheet (`TESTIMONIAL-REVIEW.md`) — ready to use as the Phase 2 tool for adding compliant social proof
- The privacy policy text and the 42 CFR Part 2 notice text (currently template copy; **attorney review is the client's responsibility before public launch** — the build is structurally compliant, but the legal wording itself awaits counsel sign-off per `COMPLIANCE.md` §6.2.4 + §6.3)

13.4 The Operations

- GitHub Pages live on `agapenj.org` with HTTPS
- Cloudflare Web Analytics enabled
- All credentials documented in your password manager (form provider, GitHub, Cloudflare, registrar)
- A 30-minute live walkthrough with your primary content editor
- A 30-day "support window" for any questions, plus an emergency contact channel

13.5 The Rollback

- The previous WordPress site remains live for 30 days post-cutover
- DNS can be flipped back in under 5 minutes
- GitHub retains every build; rolling back the new site is one click in the GitHub web UI

14. Investment Summary

14.0 Infrastructure Stack — Free-Tier Transparency

Every service in this build runs on a **Free Tier**. **No paid corporate or enterprise accounts are required for the current scope**. You may upgrade to a paid tier for any of these services in the future — and you would own that decision and its cost — but nothing in this build is contingent on a paid subscription.

Service	Tier used	Cost	What we use it for
GitHub Pages	Free (unlimited public repos)	\$0	Static site hosting; CI/CD via GitHub Actions
Cloudflare DNS	Free (unlimited records)	\$0	Authoritative DNS for agapenj.org (set up at cutover — registrar nameservers moved to Cloudflare); proxy in front of GitHub Pages
Cloudflare Web Analytics	Free (unlimited sites)	\$0	Cookieless analytics; no consent banner required
Web3Forms	Free (250 submissions/month)	\$0	Contact form relay; no server-side code
Google Workspace	(Your existing subscription)	(Your cost — unchanged)	Email hosting; NOT touched by this build
Domain registration	(Your existing registrar)	~\$15/year	agapenj.org annual renewal

Paid services you may encounter in the future (and why we did NOT use them):

- **Cloudflare Pro / Business** — needed for advanced rate-limiting and WAF rules. Not required for a counseling site with the traffic profile of agapenj.org.
- **GitHub Team / Enterprise** — needed for private repos and advanced branch protection. Not required; this repo is public.
- **Web3Forms paid tier** — needed above 250 submissions/month. Phase 1 traffic fits comfortably in the free tier; migration to Donorbox or a paid form provider is a separate Phase 2 workstream if/when volume grows.
- **Anything else** — quoted as a separate Phase 2 engagement if the requirement arises. **No surprise subscriptions.**

14.1 What This Would Cost Commercially (Market Value)

The rebuild you have just received is a finished digital asset. To frame the value of what was delivered — and to anchor the pricing of the Phase 2 workstreams in §12 — the table below estimates what a professional developer would charge at standard rates to deliver the same four-component build from scratch.

Component	Market Value Range	Why It Commands This Value
1. The Performance Build	\$3,500 – \$5,000	Astro / Tailwind custom design yielding a perfect 100/100 Lighthouse score. This isn't a bloated \$50 WordPress template; it's a high-speed, high-availability digital asset.
2. Legal & Compliance Engineering	\$1,500 – \$3,000	42 CFR Part 2 and HIPAA-compliant marketing intake design. Building conditional compliance walls into your content schema (Zod validation for consent hashes) protects the client from massive regulatory liability.
3. Infrastructure Security & Mail Hardening	\$1,500 – \$2,500	Configuring Cloudflare proxying, full SSL, and deploying a Day-1 <code>p=quarantine</code> DMARC protocol. IT consultants charge thousands just to clean up spoofed domains; you are preventing it out of the gate.
4. Structural SEO & Local Optimization	\$1,000 – \$1,500	Baking schema-structured JSON-LD data into a static context ensures maximum visibility on Google Maps for local searches.
Total Phase 1 Market Value	\$7,500 – \$12,000	Plus an ongoing monthly retainer / hourly rate for Phase 2 change requests.

How to read this table: the ranges reflect what a US-based freelance developer or small studio would charge at standard rates (2026 market). The lower end is a competent generalist; the upper end is a senior specialist who has done this exact work for SUD-treatment clients before. The dev's relationship to Agape is not at standard market rates — the deliverable on disk and the 30-day support window are the actual scope. **This table exists so the board can see the value of the asset it owns, and so the Phase 2 workstreams in §12 can be evaluated against a real market reference.**

The compliance line (#2) is the easiest to undervalue. The Zod schema that requires `consent_date` + `consent_hash` on every testimonial entry is a 30-line TypeScript file that took a few hours to write — but the legal exposure it prevents (42 CFR Part 2 violations carrying \$500–\$5,000 per first offense, plus reputational risk for a recovery-services practice) is the single largest liability reduction in the build. The market range reflects that asymmetric value.

14.2 The Build (One-Time)

The Phase 1 rebuild is a fixed-scope project, scoped to the deliverables in this proposal.

Phase 1 fee: \$2,000 — invoiced separately per the `PHASE-1-ENGAGEMENT-AGREEMENT.md` (the "Phase 1 Engagement Agreement" — §3 Fee and Payment Terms). The invoice terms (due date, payment method, late-fee policy) are defined in that agreement, not in this proposal.

Why \$2,000 vs the §14.1 market range of \$7,500–\$12,000. The §14.1 table is what a US-based freelance developer or small studio would charge at standard rates for an equivalent four-component build. This engagement is priced at \$2,000 — well below market — because (a) the relationship is the priority, not the per-engagement rate, (b) the build is genuinely transfer-ready and accounts are pre-wired per §14.3.1, which reduces per-engagement overhead, and (c) the ongoing Phase 2 relationship (per `PHASE-2.md`) is where the long-term value lives. **The §14.1 anchor exists to show what you're getting, not what we're charging.**

Transfer is pending agreement. Per §13, the GitHub repository transfer, the Cloudflare account handoff, and the credentials envelope do not happen at the demo itself — they happen **upon written agreement** to the Phase 1 engagement terms (this proposal + the associated Phase 1 Engagement Agreement). Until that agreement is in place, the dev retains admin access and rollback authority over the build. This protects both parties: the client sees the live demo before committing, and the dev retains the ability to fix late-discovered issues without an ownership transfer blocking the path. See §13 for the full handoff-package contents.

14.3 The Operating Cost (Annual, Going Forward)

Item	Annual cost
Hosting (GitHub Pages)	\$0
DNS (Cloudflare)	\$0 (free tier; set up at cutover)
Analytics (Cloudflare Web Analytics)	\$0
Custom domain renewal	~\$15
Form provider (Web3Forms free tier)	\$0
Total	~\$15

14.3.1 Why It's So Low — Accounts Already Pre-Wired

The rebuild ships **transfer-ready**. By the time you see the demo, every account the site depends on has already been **named, created, connected, and documented** for the handoff envelope. The stack is already wired and tested against the demo's Pre-Demo Checklist (`DESIGN.md` v2.18.0 — 62 pass / 0 fail / 1 warn). The demo is **the moment of transfer, not the moment of setup**. You don't "go shopping" for vendors as part of the build — you inherit a working stack and become admin of accounts the dev has already provisioned.

14.3.2 The Transfer — Everything You Get

Split into four roles so it's explicit who does what, and so nothing is implicit. This is the same script the demo runs against.

What I (the dev) handle, end-to-end:

Step	What it is
Cloudflare account	Free tier; you become admin at the transfer
Nameserver move	Registrar → Cloudflare (one-time at cutover)
DMARC record	<code>p=quarantine</code> default + <code>dmARC-reports@</code> mailbox per §11.5
Cloudflare DNS records	Apex <code>A</code> records → GitHub Pages IPs; <code>www</code> CNAME; orange cloud on
Cloudflare Web Analytics	Beacon token wired into <code>BaseLayout.astro</code>
GitHub org + repo	Org created with your authorizing email; repo transferred with full history + branch protection
GitHub Pages	Custom domain configured; Let's Encrypt auto-HTTPS
Web3Forms (or Formspree)	Account + access key + email delivery config
Credentials log	Sealed envelope per §8.2.3 — every account, every key, every "where to log in"
Cutover live verification	DNS resolves correctly; HTTPS works; form posts; redirects verified end-to-end
30-day post-demo support	Bug fixes + small copy edits + DNS questions, all included

What I need from you (the client) to do those things:

Need	Why
One authorizing email address	Used to create the Cloudflare account, the GitHub org, and the Web3Forms account — one identity per vendor, one inbox to watch for transfer notifications
Domain registrar credentials (or a coordinated registrar transfer)	Needed to point <code>agapenj.org</code> nameservers at Cloudflare
GitHub org creation acceptance	You'll get an email from GitHub; clicking it creates the org I transfer the repo into
Form provider decision	Web3Forms (recommended) or Formspree — both free tier
DMARC policy choice	Default <code>p=quarantine</code> ; can escalate to <code>p=reject</code> after 90+ days of clean reports
Sign-off on this proposal	Triggers the build → demo sequence

What you (the client) need to do yourselves:

Step	Why
Add credentials to your password manager	Live, during the demo, with my verbal walkthrough of each account
Cancel the Town Square Interactive contract	After the 30-day safety net ends — the legacy site remains live for 30 days post-cutover as a rollback safety net
Communicate the change internally	Board, intake staff, IT — anyone who used to log into the old vendor portal needs to know the new edit flow lives in <code>EDITING_GUIDE.md</code>
Schedule the demo	~60–90 minutes; the dev confirms availability within 1 week of build completion

Everything transferred to you upon agreement (per §14.2 + §13 — pending the written engagement terms, not at the demo itself):

Asset	What it is
GitHub repository	Full commit history, all branches, <code>main</code> branch protection (PR + 1 approval), <code>LICENSE</code> , <code>README.md</code>
Cloudflare account	You become admin; DNS + analytics + DMARC under your control
Web3Forms (or Formspree)	Access key + email delivery config
Domain management	Either registrar transfer or documented registrar credentials (your call)
Credentials log	Every account, every key, every "where to log in" URL
<code>EDITING_GUIDE.md</code>	Non-technical guide for day-to-day content edits (services, hours, FAQ, access banner)
Loom walkthrough	Screen recording of a real edit-and-deploy cycle
<code>COMPLIANCE.md</code>	Implementation status of every §6 item — the document your future counsel reaches for
<code>PHASE-2.md</code>	The Phase 2 workstream catalog with size + cost framing
30-day post-demo support window	Bug fixes + small copy edits + DNS questions, all included

The full handoff package is also described in §13 (Handoff Package — What You Own Now); this §14.3 is the **operating-cost framing** of the same transfer.

Compared to the legacy SaaS fee of **\$1,788/year**, the annual savings are **~\$1,773** — recurring, year over year.

14.4 The Strategic Value (Hard to Put a Number On)

- **Compliance posture:** 42 CFR Part 2 exposures closed; HIPAA-aware intake posture documented.
- **Performance:** Sub-1.5s LCP on a mid-range mobile device.
- **Ownership:** You hold the repo, the code, the content. No vendor.
- **Editability:** Plain Markdown. Anyone on your team can do it.
- **Resilience:** Rollback is one click. Migration to a different host is a `git remote add`.

14.5 The Risk Reduction

Risk	Before	After
Vendor pricing change	High	None
Vendor shutdown	High	None (GitHub Pages is core product; Cloudflare is infrastructure)
API key theft	High (exposed Google Maps key)	None (no third-party key)
42 CFR Part 2 violation	High (FB embeds + GA + 7 un-reviewed testimonials)	Low (ship-without-testimonials + compliance review + posture documented)
WCAG complaint	Unknown	Low (AA certified)
Slow mobile loads on 3G/4G	High	Low

15. Next Steps

1. **Sign off on this proposal** so we can proceed to the build.
2. **Approve the form provider** (Web3Forms recommended; Formspree alternative).
3. **Confirm the EIN** for the 501(c)(3) disclosure.
4. **Reply to the mid-build Progress Confirmation email.** About halfway through the build, we'll send a single email summarizing what's done, what's in progress, and any decisions still needed. If anything looks off, you reply and we adjust before the demo. If everything looks right, you don't need to do anything — the build continues to the demo.
5. **No testimonial decisions are needed for launch.** The site ships without testimonials (a future-ready, compliance-first choice). When you're ready to add signed, compliant testimonials, the `TESTIMONIAL-REVIEW.md` worksheet is provided as a Phase 2 tool — drop a signed `.md` file in and the section appears on its own.
6. **The demo.** A single 60–90 minute session where the site and the full handoff package are presented end-to-end. **The repository transfer is pending the Phase 1 Engagement Agreement** — it happens upon written countersignature of `PHASE-1-ENGAGEMENT-AGREEMENT.md`, not at the demo itself. The dev retains admin access and rollback authority until that agreement is in place. The old Town Square Interactive site remains live for 30 days post-cutover as a safety net, then is canceled.

End of proposal. This document is the source of truth for the rebuild scope. Any technical question, contact the dev directly.
